Monomial is a number, variable or product of a number and one or more variables with nonnegative integer exponents.

## rules of exponents

The laws or properties of exponents set down rules for operations involving exponents.
An exponent shows how many times a base is multiplied.

## Property

Examples

## zero exponent property

For a $=0$ :
$a^{0}=1$
$5^{0}=1$
$5^{0} \times 5^{2}=5^{(0+2)}=5^{2}=25$
negative exponent property

For $\mathrm{a} \neq 0$ :
$a^{-b}=1 / a^{b}$
$5^{-2}=1 / 5^{2}=1 / 25=0.04$
$5^{-2} \times 5^{4}=5^{(-2+4)}=5^{2}=25$
product of powers property
To multiply two powers having the same base, add the exponents.
For $\mathbf{a} \neq 0$ :
$3^{3} \times 3^{5}=3^{(3+5)}=3^{8}$
$\mathrm{a}^{\mathrm{b}} \times \mathrm{a}^{\mathrm{c}}=\mathbf{a}^{(\mathrm{b}+\mathrm{c})}$ $5^{2} \times 5^{4}=5^{(2+4)}=5^{6}$
quotient of powers property
To divide two powers having the same base, subtract the exponents.
For a $\neq 0$ :
$3^{4} / 3^{2}=3^{(4-2)}=3^{2}=9$
$a^{-b} / a^{-c}=a^{b-c}$ or $\frac{a^{-b}}{a^{-c}}=a^{b-c}$
$5^{3} / 5^{2}=5^{(3-2)}=5^{1}=5$
power of a product property
To find the power of a product, either find the power of each factor and multiply or multiply the factors and raise the product to the power.
For $a, b \neq 0:$
$a^{c} \times b^{c}=(a b)^{c}$ or $a^{c} b^{c}=(a b)^{c}$$\quad \begin{aligned} & 2^{2} \times 6^{2}=(2 \times 6)^{2}=12^{2} \\ & 2^{2} \times 6^{2}=(2 \times 6) \times(2 \times 6)=12^{2}\end{aligned}$
power of a quotient property
Similar to power of a product property. Cancelling may be used.
For $\mathrm{a}, \mathrm{b} \neq 0$ :

$$
\frac{\mathbf{a}^{\mathbf{c}}}{\mathbf{b}^{c}}=\left(\frac{\mathrm{a}}{\mathrm{~b}}\right)^{\mathrm{c}}
$$

$$
\left(\frac{a}{3}\right)^{3}=\frac{a^{3}}{3^{3}}=\frac{a^{3}}{27}
$$

$$
\frac{20^{3}}{4^{3}}=\frac{5 \cdot 4 \cdot 5 \cdot 4 \cdot 5 \cdot 4}{4 \cdot 4 \cdot 4}=5^{3}
$$

power of a power property
To find a power of a power, multiply the exponents.
For $\mathbf{a}, \mathrm{b}$ and c :
$\left(3^{2}\right)^{4}=\left(3^{2}\right)\left(3^{2}\right)\left(3^{2}\right)\left(3^{2}\right)=3^{2+2+2+2}=3^{8}$
$\left.\mathbf{a b}^{\mathrm{b}}\right)^{\mathrm{c}}=\mathrm{a}^{\mathrm{bc}}$
$\left(2^{3}\right)^{3}=(2)^{3 \times 3}=2^{9}$
rational (fractional) exponents
The exponent $\%$ works like a square root.
For $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ :
$a^{\frac{c}{b}}=\sqrt[b]{a^{c}}=(\sqrt[b]{a})^{c} \quad \begin{aligned} & 5^{1 / 2}=5^{1 / 2} \times 5^{1 / 2}=5^{(1 / 2+1 / 2)}=5^{1}=5 \\ & 7^{1 / 3}=7^{1 / 3} \times 7^{1 / 3} \times 7^{1 / 3}=7^{(1 / 3+1 / 3+1 / 3)}=7^{1}=7\end{aligned}$
